

ANIMAL ADAPTATIONS

Scavenger Hunt

GRADES 4 - 5

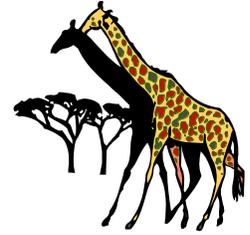

Saint Louis Zoo

Animals Always®

Scavenger Hunt

Animal Adaptations (4-5)

Teacher's Guide

Updated Summer 2011

APPROXIMATE TIME: 90 Minutes

Suggestions for Teachers:

1. Allow your students about 90 minutes to complete this scavenger hunt. The questions will take to various areas around the Zoo. Remember during colder months there may not be as many animals on display outdoors.
2. Divide your class into smaller groups supervised by an adult. This scavenger hunt is intended to be a cooperative learning experience requiring group effort and participation. We suggest that you allow each group to decide which roles individual students will have before beginning the scavenger hunt. For example, one student might record answers for the group with the understanding that the group will meet for discussion and completion of their individual scavenger hunts after visiting each area of the Zoo.
3. Copies of the Saint Louis Zoo map are available and can be used to help direct the students to the various areas while completing the scavenger hunt.

Library Resources:

Check out our library resources at <http://www.stlzoo.org>.

Scavenger Hunt

Animal Adaptations (4-5)

Answer Key

Because the animals at the Zoo are living creatures with very special needs, at certain times some of the animals referred to in this scavenger hunt may not be on public display. **Please remind your student to do their best to complete the hunt by carefully observing the animals they find and not to worry about any that are off display.** We update our scavenger hunts on an annual basis during the summer months to be able to provide you with the most accurate information about our animals.

Answers

1. On land, the black-necked swan would have difficulty walking. The position of their legs makes it easy for them to swim in the water.
2. b
3. Two adaptations would be camouflage and the method of food selection. Through camouflage the grayish-brown colored feathers allow the Tawny Frogmouth to blend in with its ground-cover surroundings. Although it is a rapid flier, and could get its food using flight movement, it is a large-mouthed ground feeder instead, eating mostly insects, grasshoppers, snails, slugs, and mice. Other examples are shown in the chart below.

STRUCTURE	ADAPTATION	FUNCTION
a. Body Covering	Brown/gray color of feathers	Blends into ground cover
b. Mouth	Large mouth with modified beak	Enables it to catch insects and small animals the size of mice
c. Eyes	Large in size	Vision is important for hunting and survival
d. Neck	Rotates 180 degrees	Compensates for little eye rotation in socket

4. The hornbill takes extreme measures to protect its young. One way is that the female is walled into the nest hole in the tree where the eggs will incubate. Another precautionary measure is that the female must rely entirely on her mate for food until the young are ready to break out of the walled-in nest.
5. a
6. b
7. d
8. Anodorhynchus hyacinthinus / Homo sapiens
9. d
10. c
11. d
12. d

13.a

14.d

15.a and c

16.b

17.c

18. The skink should have an elongated body, long flexible tail, and sharp claws.

VOCABULARY

Adaptation - A physical characteristic or behavior used to help an animal survive.

Amphibian - A cold-blooded animal that spends part of its life in water and part of its life on land.

Arboreal - Tree dwelling

Bird - A warm-blooded animal that has feathers, two legs, two wings and a beak.

Brachiating - Able to swing by the arms from branch to branch

Diurnal - Active during the day

Endangered - Close to extinction, in need of protection

Herbivore - An animal that eats only plants

Mammal - A warm-blooded vertebrate that has hair or fur and milk feeds its young

Nocturnal - Active at night

Omnivore - Eats plants and other animals

Prehensile - Able to grasp

Reptile - Cold-blooded vertebrate that lives on land and has waterproof scales or plates

Specialized - Changed greatly during the course of evolutionary development and highly developed to a special function in life

Survival - To remain alive or in existence

Torpedo - Cigar-shaped underwater projectile

Territorial - A particular area or region inhabited by an individual or group of animals and defended against intruders

Vulnerable - Reduced population in the wild and in need of protection

Name _____

Scavenger Hunt

Animal Adaptations 4 – 5

Student Activity Pages

Over millions of years, many animals species have appeared and become extinct (died out.) The species that have survived adapted to modern conditions. They have evolved (developed over time) in ways that help them find food, escape predators, cope with their environments, and reproduce. These changes are all called **adaptations**.

Some adaptations are **physical characteristics** that you can see, or that involve how an animal's body works. Other adaptations are **behavioral characteristics** and include how an animal acts or what an animal does. Here are some examples of these adaptations:

Physical *Cat whiskers.* Long hairs growing out from the face to increase the sense of touch and help the animal to feel its way around at night.

Frog skin. Thin, moist skin with glands that open externally to secrete toxins.

Behavioral *Antelope herds.* Living in large groups (herds) helps to protect antelope from predators. With more eyes and ears alert to potential danger, predators are less likely to take the antelopes by surprise.

Animals look and act the way they do for a reason. By observing the animal's body structure and its behavior, and by using information from the signs found at each exhibit, you will discover how animals are adapted for their specific lifestyles. You will also bring knowledge from your own past experiences that will help you understand why animals make adaptations for their survival and specific lifestyles.

You will now begin your Animal Adaptations Scavenger Hunt. Be sure that you have a copy of the Saint Louis Zoo Map.

Using your map, start at The Living World and proceed in a southeast direction, around Lakeside Cafe, to Historic Hill. When you arrive, place an X on your map to show the River Otter exhibit area. Use information from the adaptation clues on the posted signs in the exhibit areas to help you answer your scavenger hunt questions.

Sea Lion Basin and Chain of Lakes

1. **Black-necked Swans** have legs that are set unusually far back on their bodies. How would this affect them on land? In the water?

2. **River Otters** have elongated bodies and short legs that they tuck alongside their bodies when they swim. They have five webbed toes with claws. They spend several hours every day cleaning their short, dense fur. Why do you think this is important?

- a. They need the fur to stay afloat.
- b. It is water impermeable and keeps their skin dry.
- c. It makes their coat attractive for mating.
- d. It covers their ear membrane when they dive.

Now, walk towards the Bird House. Place an X on your map to show your destination.

Bird House / Bird Garden

3. Find the exhibit of the **Tawny Frogmouth**. Before you read about this bird, find it in its enclosure and describe two adaptations that would help this bird survive in the wild.

<u>Structure</u>	<u>Adaptation</u>	<u>Function</u>
a. _____	_____	_____
b. _____	_____	_____
c. _____	_____	_____
d. _____	_____	_____

4. The **Great Hornbills** take extreme measures to protect their young. List two of these characteristic behaviors.

a. _____

b. _____

5. **Mimicry** is an unusual way that some animals protect themselves. They trick their predators into thinking they are a different, bigger or more dangerous animal by making a sound resembling that of another animal, or by using camouflage. Find the **Burrowing Owl**. What sound does a **young** burrowing owl mimic?

- a. the sound of a rattlesnake
- b. the sound of a raging chicken
- c. the sound of stampeding cattle
- d. the roar of a lion

6. What action is characteristic of the **Burrowing Owl** when it feels threatened?

- a. fly to and hide in a dead bush
- b. run into a pre-dug rabbit burrow or prairie dog tunnel
- c. flatten itself against the ground rather than fly
- d. both (b) and (c)

7. The **Toco Toucan** has numerous characteristics. Which listed is **not** a characteristic of the toucan?

- a. have up to a 25 inch long beak
- b. nest in tree cavities
- c. Can hear other toucan calls from over ½ mile away
- d. rests quietly on the forest floor

8. The naming system developed by Carolus Linnaeus uses the classification system of organisms. The first part of an organism's name lists the genus and the second part of its name gives its species. The scientific name of the **Hyacinth Macaw** is

_____.

What is the scientific classification of humans?

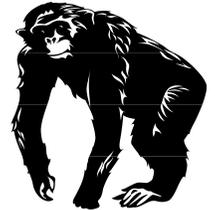

_____.

Exit the Bird House through the front door, turn right and proceed to the Jungle of the Apes. Place an X on the map to show its location when you arrive.

Jungle of the Apes / Fragile Forest

9. **Orangutans** are the only truly *arboreal* (live in trees) “great ape”. There is only one species. They move by brachiating (swinging by their arms) from branch to branch. What is it about their arms that make them especially good at this?

- a. the length
- b. the fingers can be “fixed” into hooks
- c. the thumbs are small
- d. all of the above

10. **Chimpanzees** have a highly developed brain and are anatomically close to humans. They have learned to imitate a number of actions of humans. Which of the following is **not** true of chimpanzees?

- a. The arms and legs are about the same length.
- b. They use their facial expressions to communicate.
- c. They rub hair off their face to help cool their body temperature.
- d. Usually only one young is born at a time.

Exit the Jungle of the Apes or Fragile Forest. Return to the paved route and travel in a southeast direction to Red Rocks to the Hoofed Mammal Area. Place an X on your map as you arrive.

Hoofed Mammal Area

11. How does the white coat of the **Addax** make it a desert specialist?

- a. The coat reflects the heat and keep it cooler.
- b. The coat is a valuable bounty for hunters
- c. The coat color acts as camouflage and helps them avoid predators
- d. a and c

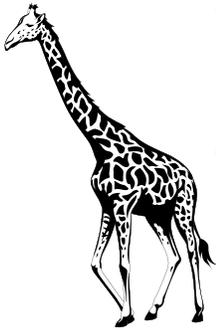

12. The **Okapi** and the **Lesser Kudus** have stripes that allow them to camouflage themselves in their habitat. The **Okapi** lives in the dense rainforests of eastern Zaire. What is the location of the habitat of the **Lesser Kudu**?

- a. Midwestern plains of North America
- b. Rainforest of South America
- c. Rainforest of eastern Zaire in west central Africa
- d. Deep thickets of Eastern Africa

13. What do **Lesser Kudus** and **Okapi** have in common that helps them hide from their predator?

- a. They both have stripes on their body or legs
- b. They both have long, spiral horns
- c. They both have the same shape of head, lips and tongue of a giraffe
- d. Both a and c

14. The **Reticulated Giraffe** has a long neck that enables them to graze on leaves of acacia, mimosa, and wild apricot trees while other hoofed mammals can't reach them. After chewing the food and swallowing it, the giraffe does not immediately digest the food. What happens?

- a. It regurgitates the food and leaves it for other animals to eat.
- b. It washes it down with water, but does not digest it.
- c. It regurgitates the food, selects new leaves to eat and continues the feeding process.
- d. It regurgitates the food from the stomach to the mouth to be chewed again as cud.

15. How does the giraffe's long neck make survival on the savannahs of Africa easier? (More than one answer is correct.)

- a. They can see and smell their enemies for great distances and take action if necessary.
- b. They can be sociable with lions, one of their main enemies.
- c. They can graze on the leaves that other hoofed mammals can't reach.
- d. They are able to keep their nostrils above any blowing sand.

On your map locate the Primate House. Travel toward the Primate House and place an X on the map when you reach your destination.

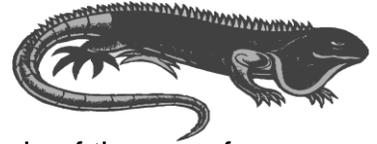

Primate House

16. The **Colobus Monkeys** have a strict plant diet and have developed bacteria in their stomach. What is the purpose of the bacteria?

- a. It dissolves sand and small stones the monkey accidentally swallows.
- b. It assists in the digestion of the plants the colobus monkeys eat.
- c. It cleans the colobus monkey's teeth after it eats.
- d. It does all of the above.

Exit the Primate House. Proceed toward the Herpetarium. Locate and mark your destination with an X on the map.

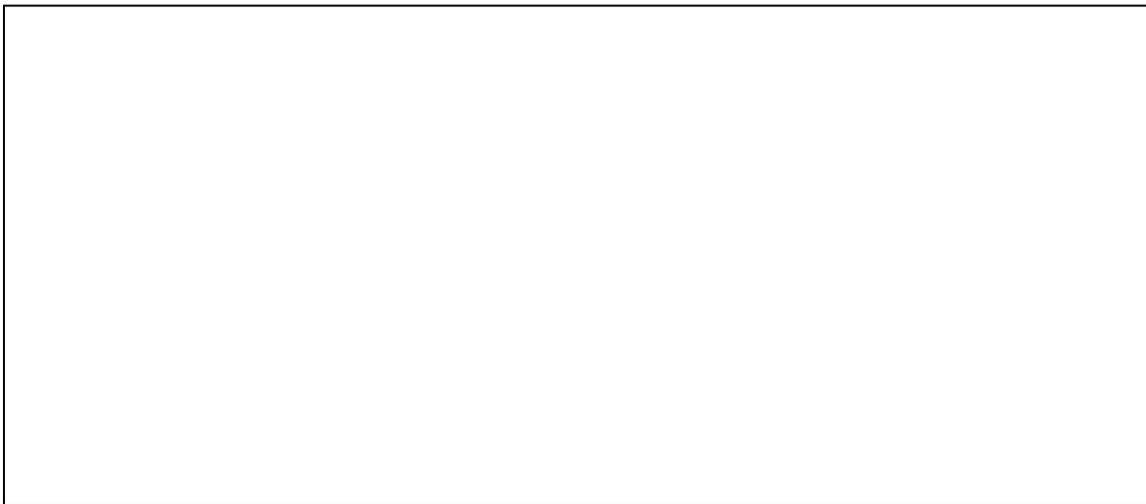

Herpetarium

17. Find **Garido's Crested Anole**. This animal is an excellent example of the use of

- a. Parenting skills
- b. Varied sound vocalizations
- c. Camouflage that enables it to imitate the bark of trees on which it lives.
- d. None of the above

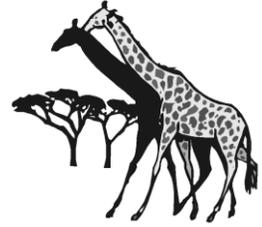

18. Draw a picture of the Solomon Island **Prehensile-tailed Skink** using its primary adaptation.

Scavenger Hunt

ANIMAL ADAPTATIONS 4 – 5

Student Summary Activity

DIRECTIONS: *Using at least four of the physical and behavioral adaptations you have encountered on this scavenger hunt, draw an imaginary animal that exemplifies these characteristics. Give your animal a common name. Then use the naming system developed by Carolus Linnaeus to develop a scientific name. Remember, the first name refers to the genus and the second names the species.*

Common Name: _____

Scientific Name: _____
